

Mr. Rohan, currently under the care of Dr. Khan, has been referred for a comprehensive health assessment, despite reporting no specific health complaints. Taking a proactive stance towards his health, he has undergone a thorough evaluation, including a Complete Blood Count (CBC) and Biochemistry analysis. The obtained results have unveiled pertinent hematological insights, with his Hemoglobin (Hb) level recorded at 11.0 g/dl, slightly below the lower limit, indicating a potential indication of mild anemia. However, his Red Blood Cell (RBC) Count falls within the normal range, suggesting adequate erythrocyte production. Nevertheless, the Packed Cell Volume (PCV) is slightly diminished at 30%, correlating with the observed lower hemoglobin level, while the Mean Corpuscular Volume (MCV) of 65 fl indicates microcytic anemia, warranting further investigation into its underlying causes.
